

Comment from Jim Gerlach

My wife is electrohypersensitive and unable to be exposed to radar, microwave, cellular, cordless, and or other electromagnetic fields. Your interest in putting such radiation in cars or exuding from the perimeter of cars is horrid. How do you expect to comply with Americans with Disabilities Act mandates for reasonable accommodation? Do you plan to have automatic shut off switches in vehicles proximate to anyone who is a known electrohypersensitive? What about the undiagnosed victims like my brother-in-law who is dying of brain tumors as we speak from proximate exposure to his cell phone because our society does not consider it prudent to caution people about such hazards. I don't want any form of radio in my wife's car and I don't want the car to be capable of being hacked and controlled remotely like I have observed in Jeep production vehicles and others that needed to be "snuffed out" with vehicular misdirection, acceleration, and other lock down controls that have no business in human transportation.
