

Comment from Arthur De Volve

NO. No inter connectivity is necessary or beneficial. Drivers are already distracted, going down the road, punching data and menu choices on their touchscreens. More of this will just lead to more distracted driving/accidents.

Most importantly, any tech of this sort should be *easily* disabled by the driver. Any data should be the legal property of the driver and or owner. And, no one should be able to legally demand or demand by incentive that the driver keep these devices engaged, or even in the car. In fact it should be required that the entire device should be removable from the vehicle as easily as unplugging a fuse and there should be no mandate by anyone that the device be in the vehicle or passed on with the vehicle when sold or traded.
