

Comment from Susan Brinchman

Virtually all independent, non-industry research shows that rf microwave radiation is hazardous to health. Devices emitting this type of radiation should not be allowed due to these clear public health hazards, which include, but are not limited to cancers, immunological and neurological impacts, DNA single and double-strand breakage, memory problems, inflammatory diseases, and a likely contributor to obesity, diabetes, Alzheimer's, early onset dementia, and autism. It is irresponsible to consider placing technologies in vehicles that have these risks and hazards, for an unknowing public, and ultimately forcing the public to expose themselves to these hazardous rf emissions, in order to use transportation. Further, it is entirely unnecessary, and simply a profit-seeking industry-driven effort. Our government should protect our citizens and residents, not collude with industry to harm them. www.electrosmogprevention.org
