

Comment from Scott Johnston

I have several issues with this new technology. I don't think it is the proper role of government to be involved in the establishment of the technical specifications or use of the technology. If there are going to be regulations associated with this technology it should be set out in this way.

If a purchaser of a vehicle or system that contains this technology, they should have the opportunity to opt-out or disable the use of said technology. It should not be mandated to use.

If companies want to use this technology they should bear the expense of the build-out of infrastructure. Car owners or tax-payers should pay for infrastructure. This should be the responsibility of those who will profit from its use.

Additional technology added to vehicles should be completely transparent to the driver. We don't need additional distractions forced upon drivers. A lot of the new technology added to vehicles makes it more difficult to operate. Dials and buttons are much more tactile and easier than being distracted by a touch screen.
