

Comment from Nicole O'Quinn

I object to the V2X Communication technology for the following two reasons: cost and invasion of privacy.

Instituting this technology is going to be costly and even more so if the Government is going to foot the bill. The Government is notoriously bad at defining requirements which is why nearly all large Government projects cost many times more than the original estimates. We the taxpayers will be paying for another large Government project with dubious results and many unintended consequences.

In order for this technology to work somebody or something needs to know where your vehicle is at all times. This data is open to exploitation by Government agencies, Law Enforcement agencies, commercial entities, and criminal elements. What most people don't seem to understand is that individual pieces of your travels are not informative, but string together each trip on a timeline then a picture of your life and habits emerges. This technology then becomes back door surveillance
