

Comment from Melissa Hartley

The Federal Motor Vehicle Safety Standards: V2V Communications is deeply flawed. V2V communications are an invasion of privacy, would cause a huge increase in electromagnetic radiation pollution with deleterious health effects to people, plants and other living things. V2V communications would also cause more toxic pollution in the form of the devices themselves. It would also result in negative economic impact due to disabilities.

The rationale for V2V safety features is vague and not justifiable. On the other hand, the known facts about the harmful effects of EMF and other forms of radio radiation, should be well-known.

We are already on the verge of being inundated with 5G technology and smart meters, which have been proven by independently funded studies to cause great harm to human health by this form of radiation.

People develop sensitivity, sometimes severe, to electromagnetic frequencies. You may have read many studies proving the deleterious effects of this kind of radiation. This report from Bioinitiative 2012, a group of scientists and physicians with expertise in this area, is a good introduction to the problem of EMF exposure if you are not aware of this important public health issue.

<https://bioinitiative.org/>

I strongly disagree with a move to require V2V communications based on the reasons stated above.

Thank you.
