I strongly oppose radar in cars. Electro hypersensitivity is increasing in populations and if the 5G goes ahead, there will be an unprecedented increase in this handicap. People in cities are being enveloped in a cloud of EMF, but at least some measure of relief is available in more remote areas . . . which would need to be accessed by vehicles. Mandating radar in cars leaves the victims of EHS with no transportation. The National Toxicology Study has proven that EMF is cancerous. Technology is moving ahead without care or concern for the detrimental health aspects. Please read the thousands of independently funded studies, listen to the scientists!
