Please keep all vehicles with a full manual ability if needed, steering wheel, pedals.

Aircraft have had autopilot for a long time with back-up for manual pilot control, why? because technology is not ready to AUTO everything without manual abilities.

We are not ready for no steering wheel or pedal or gear shift to take over. What happens if a virus gets into the program and it is not functioning? Or anything that impedes the automotive system? Or our GPS systems is messed up, a person cant take over and drive if no manual system back up. Or it turns on roads with no lines on roads by mistake? Airplanes still have an manual system. How can auto makers such as GM even think of not having a complete manual system back up?

Besides, how safe will our roads be if auto-self driving cars have mess ups while driving and we have hundreds or thousands that loose auto driving ability at the same time due to a Glitch in the programming? Self-driving vehicles have not had a long enough perfect record. Don't place humans a "testing deaths" for this technology; now is not the time.

Thank you for asking for comments.
